WARMUP HEATING SYSTEMS INC.

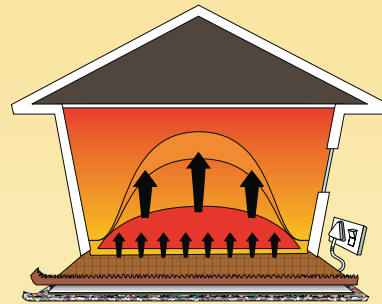

Heating for every floor surface

WHY UNDERCARPET HEATING?

Since 1984, Warmup has provided safe, comfortable and economical heating to thousands of satisfied customers throughout South Africa. Consider these benefits of our new improved heating system.

The heat pattern from heaters and radiators shows that much of the heat rises to the ceiling and is lost through windows, leaving the living area of the room as the last area to heat up.

With Warmup Undercarpet Heating the heat rises gently through the room, delivering heat directly to the living area with minimum heat loss.

SAFE

Warmup undercarpet heaters are safety tested and are completely waterproof. It is encased in a tough "earth shield" which withstands heavy traffic and eliminates the risk of electric shock.

UNOBTRUSIVE

Discreetly hidden from view, this wafer-thin heater lies hidden between the carpet and underlay. There are no visible elements or radiators. No summertime storage problems.

TECHNOLOGY

Warmup components have the benefit of over 30 years of European technology for applications that demand high flexibility, continuous operation at high temperatures and long working life.

CARPET TYPE

Under any modern polypropylene or hessian-backed and woven carpet. Even coir or sisal carpets, but not under rubber or foam-backed carpets.

CONTROL

While Warmup heaters have been designed to never overheat - and may be left on continuously - timers and thermostats are available as optional extras for additional control.

INSTALLATION

Quickly installed under new or existing carpets by any competent carpet fitter, or D-I-Y installations under loose rugs.

UNDERLAY

A good quality acrylic underlay will prevent downward heat loss, a minimum of 1000gsm should be used. No foam or foam-chip underlays.

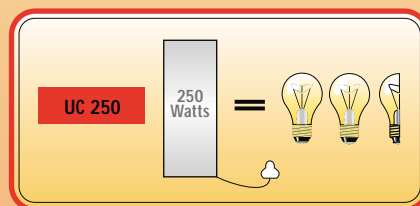

ECONOMICAL

This is not underfloor heating, and is effective within 30 minutes of switch-on. You heat the area you need, when you need it.

GUARANTEE

A 5 year factory-backed warranty is provided. Warranty forms are issued with each heater.

To give you an idea of the economy of Warmup... a UC250 (70 x 180cm) undercarpet heater uses less power than three 100 watt light bulbs.

WARMUP'S COMPREHENSIVE MODEL RANGE

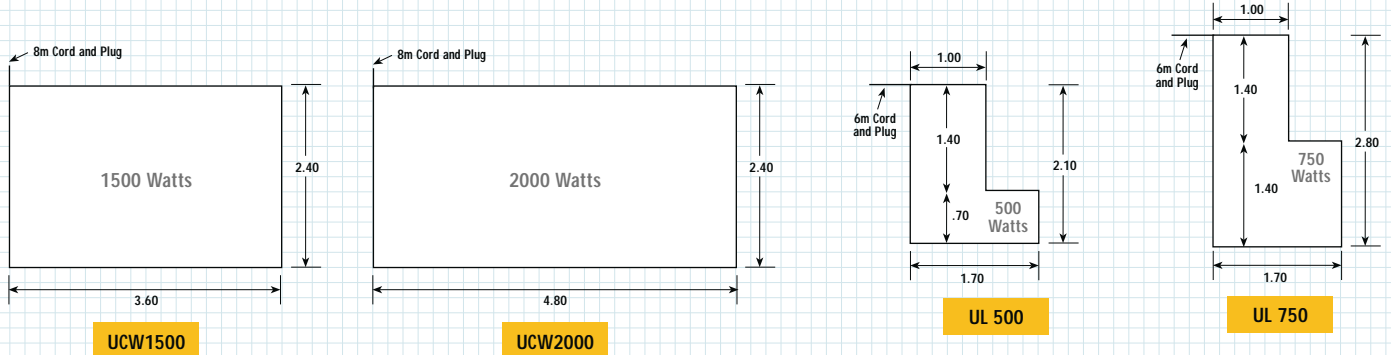

STANDARD UNITS

PASSAGE UNIT

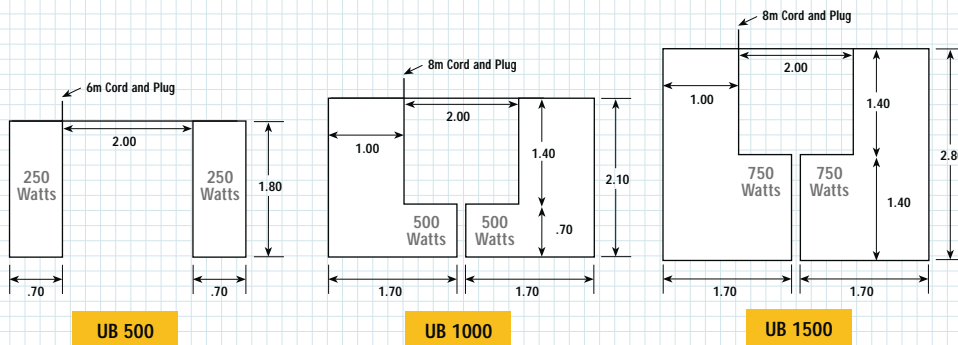

WIDE UNITS

"L" - SHAPED UNITS (HALF "U"-SHAPED BEDSETS)

BEDSETS - INCLUDING OUR UNIQUE "U"-SHAPED BEDSETS TO FIT AROUND A DOUBLE BED

HEATING FORMULA

Calculate in square metres.
 Eg. Main bedroom is 4.00 x 4.50 = 18m²
 18m² x 80watts heat = 1440 watts required.
 Therefore a 1500 watt
 will heat the required area.

IMPORTANT

Very cold rooms, high ceilings and open plan areas should be calculated at 100 watts per square metre rather than 80 watts per square metre for required heat.
